TRAINING JOURNEY · DAYS 1–4

From zero to a live website and my first database

Renuka Jadhav · Accounts & Finance · 15 October 2026

4 days complete

26 / 26 tasks closed

1 live website

1 working database

AT A GLANCE

Four days, every task closed

4/4

days complete

Setup · Git · Website · Database

26

tasks closed

25 done, 1 not required by my manager

33

commits on GitHub

Every step saved as proof

4

daily notes sent

One note to my manager each day

WHAT I BUILT

Real things, live and shareable

Live profile page

A professional résumé page on GitHub Pages

renukajadhav-spec.github.io/training

Vendor database

15 vendors in Supabase, 3 saved SQL questions

Over limit · Balance by city · Overdue

GitHub repo

Notes, files and proof, saved in 33 commits

github.com/renukajadhav-spec/training

Reports

A 5-slide presentation and a progress report

Both as PDFs in the repo

DAY 1

Set up my laptop and met VS Code

WHAT I BUILT

My training workspace and first notes

Set up VS Code, Claude Code and Git, then wrote my first notes.md with a heading, a list and bold text.

WHAT I LEARNED

VS Code is a free editor where we can build our own tools to replace manual work, and Claude Code inside it can read my files and run commands for me.

STUCK → SOLVED

git --version failed because I typed it without the space. Also, Git works in Git Bash, not PowerShell.

DAY 2

Git and GitHub: saving every version

WHAT I BUILT

My GitHub repo, with full history

Connected my training folder to GitHub, made 4 commits to notes.md, and merged a practice branch back into main.

github.com/renukajadhav-spec/training

WHAT I LEARNED

A branch is like a photocopy of my homework: I try changes there without touching the main version, and merge them back when they're good.

STUCK → SOLVED

The GitHub CLI download was blocked on our network, so I created the repo on the website and connected it with git remote add.

DAY 3

My own profile page, live online

WHAT I BUILT

A live professional résumé page

Planned in Plan mode, built by Claude, changed in plain words, published with GitHub Pages. Now upgraded to a two-column résumé.

renukajadhav-spec.github.io/training

WHAT I LEARNED

Plan mode is like seeing the cake design before the baker bakes it: Claude shows the plan first and builds nothing until I approve.

STUCK → SOLVED

I rejected the plan by mistake. Claude showed it again with a sketch, and I approved it.

DAY 4

My first database, with SQL

WHAT I BUILT

A vendor database in Supabase

15 vendors with GSTIN as the primary key, and 3 saved SQL questions:

5 over limit | 8 city totals | 6 overdue

WHAT I LEARNED

Excel is a personal notebook on my desk. Supabase is a shared office register: strict rules, RLS, and only one true copy.

STUCK → SOLVED

I typed my question in English and got a syntax error: the SQL Editor only understands SQL. And due_date had to be a date, not text.

MY TOP LEARNINGS

Big ideas, in my own words

Commit

A labelled snapshot of my work that I can always go back to

Branch

A photocopy of my homework to experiment on safely

Plan mode

See the cake design before the baker bakes it

CSV

A table as plain text: values, never formulas. Keep Excel as the master

Excel vs Supabase

A personal notebook vs a shared office register

RLS

A bank locker room: only allowed people make allowed changes

WHAT'S NEXT

From a database to a real app

Day 5 Vendor page from Supabase, overdue in red

Day 6 A clear brief (PRD) and pull requests

Days 7–8 Build the Expense Claim app

Days 9–10 Fix feature requests, then the final demo

QUESTIONS FOR MY MANAGER

1. My repo is public so GitHub Pages works. Is that OK?
2. Is the profile page enough, or should I add more sections?
3. Should I keep the same Supabase project for Day 5?
